Excel Lab 1 Write-Up

1. Total Sales by Store:

The analysis reveals that Dallas Galleria generated the highest revenue among all store locations. North Star and Barton Creek followed, with moderate sales figures. This indicates that Dallas Galleria is a high-performing location, but could benefit from increased inventory and targeted marketing efforts to further build on its strong customer base.

2. Sales Over Time:

Sales trends over time showed a noticeable increase towards the weekend, with peak sales occurring on Fridays and Saturdays. This pattern indicates higher customer activity during the weekend, so promotional campaigns and staffing should be optimized for these days to maximize revenue and responsiveness.

3. Top Selling Hours:

The most profitable hours were in the evening, between 12 PM and 8 PM. This data highlights the importance of evening foot traffic and suggests that stores should ensure adequate staffing and inventory during these hours to meet high demand and improve the customer experience.

4. Top Products:

A small number of SKUs sold accounted for a significant portion of revenue. These top-performing products should be prioritized in inventory planning and featured prominently in marketing material. Understanding which products drive the most sales can help streamline inventory and improve profitability.

This Excel data analysis provides insights into store performance, customer behavior, and product popularity. With these results, the business can make informed decisions to improve sales, streamline operations, and improve overall customer satisfaction across multiple locations.
